OTIF AND 3PL TRACKING

Delivered On Time, In Full?

Your customers already know. Turn your order data into a scorecard that shows where deliveries fail, why, and what it costs.

Company Page · Blog

Matt Protopapas, PhD

THE OPPORTUNITY

Your customer is already measuring your delivery service

An SME is measured whether it measures itself or not, by retailers, by key accounts and by the 3PL's own report.

A FEELING

"Pretty good, we get the odd complaint."

"The carrier has been a bit slow lately."

The customer remembers the order that came four days late, and the one that came on time with half the quantity. They don't care whose fault it was.

A SCORECARD

A number, at the right grain, against a target.

"Carrier X delivered 77.6% of its lines on time against a 91.4% target, costing us €494k of late-delivered orders." That settles the review meeting before it becomes an argument.

WHAT IT IS

From “we get the odd complaint” to “here is where, why and how much”

OTIF asks one question per order line: did the customer get what was promised, when it was promised?

1

Your order lines

Export from your WMS, TMS or ERP: quantities ordered, shipped and delivered, with promised and actual dates.

2

Validate and compute

Bad rows are rejected with a reason. The rest become OTIF and 3PL KPIs against target.

3

Scorecards and losses

By warehouse, carrier, product and month, with a value at risk on every failed line.

Example: an order of five lines, four complete and one short, is 80% OTIF, not “delivered”.

Demo: 870 orders · 1,802 lines · 6 warehouses · 5 carriers · 12 months. Synthetic data.

Kedros Analytics

WHAT YOU GAIN

Six ways it pays off for a small business

1 The customer’s view

Measured per order line, the way the customer’s receiving dock sees it.

2 Warehouse or carrier?

On-time shipping next to on-time delivery shows whose problem it is.

3 Money on every miss

Each failed line carries a value at risk, so problems rank by cost, not frequency.

4 Effort on few causes

A Pareto of root causes typically shows three or four driving 70–80% of the loss.

5 Hold the 3PL to contract

A carrier scorecard from your own data turns a dispute into a review meeting.

6 Data you can defend

Impossible quantities, backdated deliveries and duplicates are rejected, with a reason.

Highlighted: the two that change the 3PL conversation fastest.

THE HEADLINE NUMBERS

Warehouses ship on time, but goods still arrive late

Executive summary of the demo network: 1,660 clean order lines, every KPI against target.

OTIF

88.7%

Against a 93.3% target, 4.5 points off.

Roughly one order line in nine failed the customer's promise.

ON-TIME SHIPPING → DELIVERY

97.1% → 92.6%

The gap is the carriers'.

Shipping beats its 95.9% target. The goods leave on time and arrive late anyway.

PERFECT ORDER RATE

84.1%

Add damage-free and complete paperwork.

One order line in six had something wrong with it.

Receiving is not the problem: inventory record accuracy 97.7%, putaway accuracy 99.5%, inbound fill rate 99.3%.

EXAMPLE RESULTS

Every site misses for a different reason

OTIF against each site’s own target. No warehouse meets it, and the network average hides why.

ROTTERDAM

Nearly there

OTIF 94.8% vs 95.0% target

Flagged At Risk. Posted 100% in five of thirteen months.

ATLANTA, MUNICH

Availability

On-time on target, in-full short

In-full is 94.6% in Atlanta and 96.1% in Munich. A purchasing and replenishment conversation.

SINGAPORE

Transport

In-full 98.0%, on-time 86.6%

Fine on stock, badly off on speed. A carrier conversation.

SÃO PAULO

Inbound

OTIF 74.7% vs 88% target

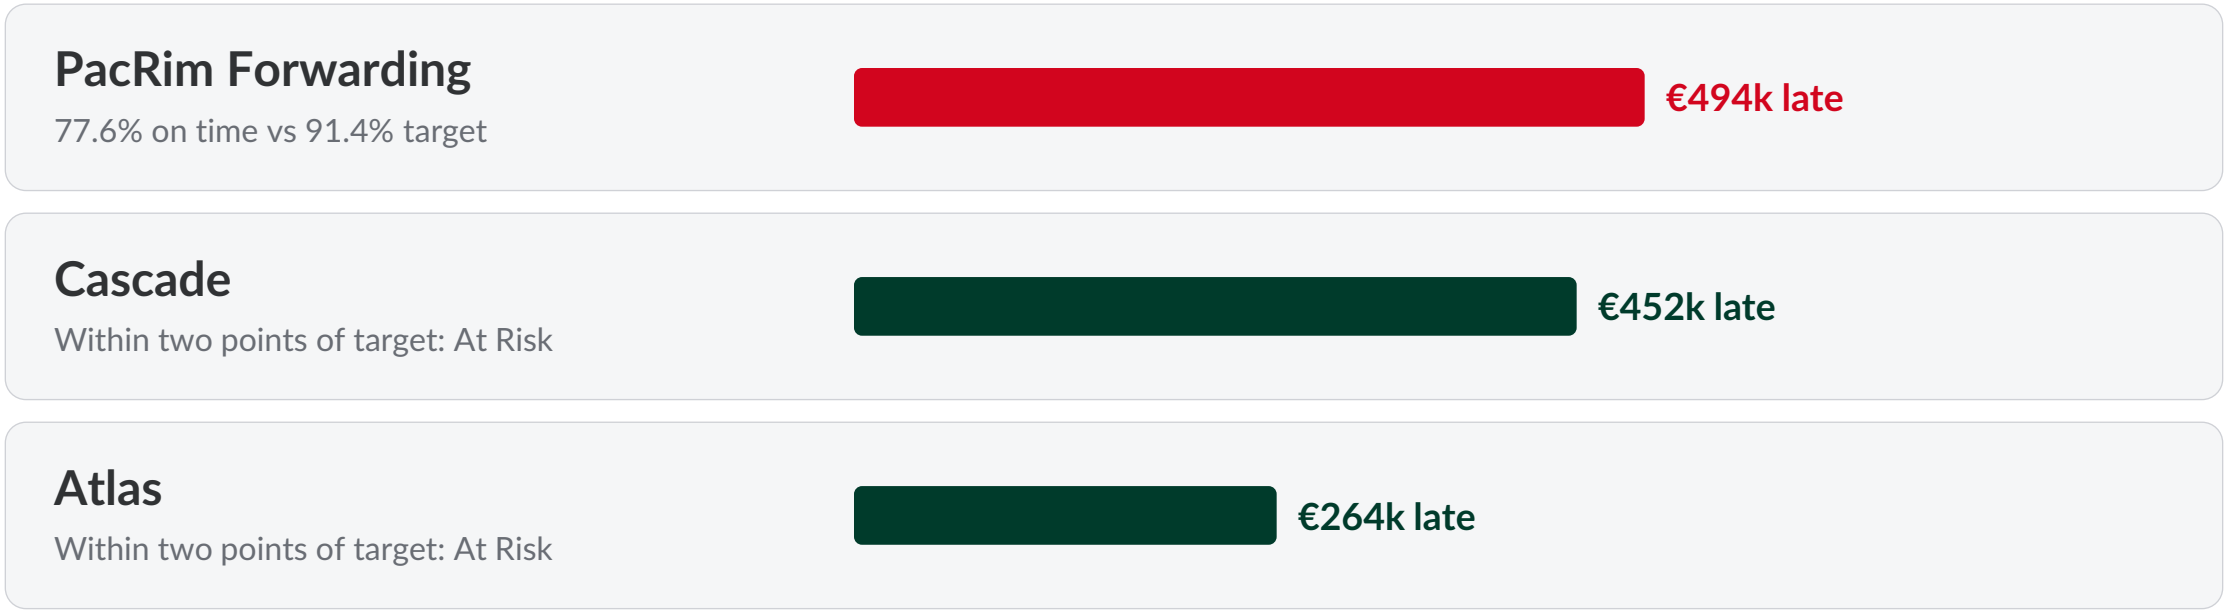

13 points off. Dock-to-stock 24.2 h against a 20 h target, and 61 of the 187 failed lines.

Synthetic demo data. Targets are illustrative, set per warehouse.

THE 3PL SCORECARD

A small rate gap on large volume is still a lot of money

Value delivered late by carrier (€k). Atlas and Cascade carry over five times PacRim's line volume.

Nordwind Freight and Meridian 3PL hit their on-time targets, which is what makes the comparison fair.

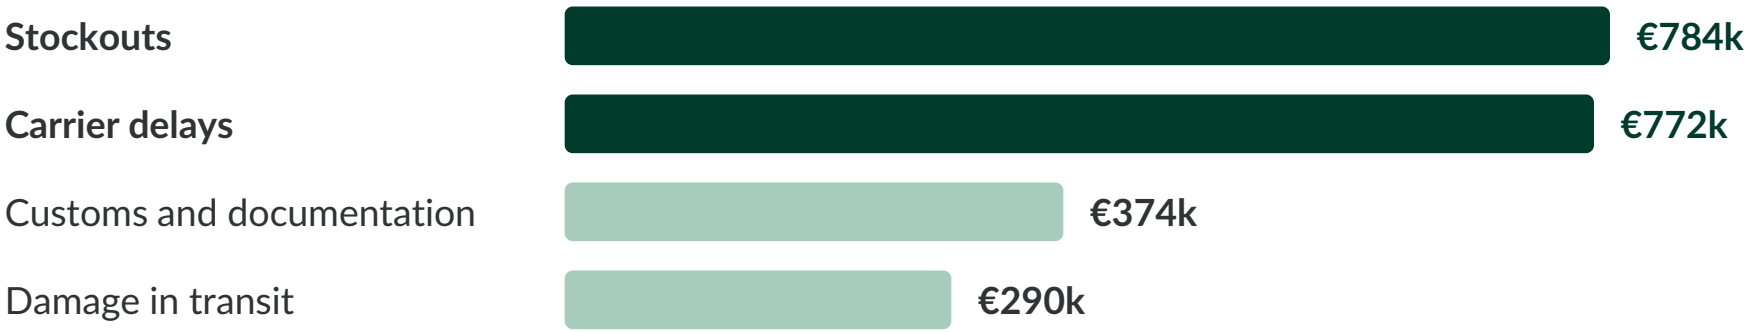

Synthetic demo data. Targets are volume-weighted by the lanes each carrier serves.

Kedros Analytics

WHY IT HAPPENS

Four causes explain 80% of the money at risk

Value at risk by root cause (€k), across the 187 failed order lines in the demo.

56% sits in two causes

Stockouts and carrier delays are different problems with different owners.

Six causes share the last 20%

Supplier inbound delays, dock capacity, pick errors, weather, order entry and customer refusals.

Synthetic demo data. One glove SKU alone: 60.6% OTIF, €436k never delivered, due to stockout.

BUSINESS IMPACT

Putting a price on missed promises

Twelve months of the demo distributor: six warehouses, five carriers.

€2.78M

of orders did not arrive as promised, roughly one euro in eleven of shipped value.

€1.25M never delivered

1,570 units short. Revenue at direct risk.

€1.53M delivered late

8.2 days late on average. Exposed to chargebacks, expedite fees and eroding relationships.

Closing the gap is bounded: one carrier lane, one SKU, one dock.

GET STARTED

What to do this week

Five steps from an order-line export to a monthly scorecard.

1

Export

Six to twelve months of order lines with quantities and promised and actual dates.

2

Define

Agree the grace days for “on time” and that a partial delivery is a miss.

3

Run

Start with three views: executive summary, root-cause Pareto and carrier scorecard.

4

Assign

Owners by cause: purchasing for stockouts, the 3PL review for carrier delays.

5

Repeat

Re-run monthly. The trend shows whether each fix worked.

No actual delivery date in your system? That is finding number one: you cannot measure OTIF without it.

KEEP IT HONEST

The limits worth keeping in mind

OTIF measures promise-keeping. It informs a decision, it is not the decision.

1 Only as good as the promise

Generous quoted dates make for excellent OTIF while customers wait. Pair it with order cycle time.

2 Root causes must be captured

One reason-code field on the claim or service ticket is usually enough to start the Pareto.

3 Targets are a decision

They come from the customer contract, the 3PL SLA or an honest read of the lane. Unagreed, a target is just a red cell.

4 Small cells are noisy

Munich’s 69% fill rate in May is one order line, not a trend. Read monthly cells with the volume in mind.

HOW KEDROS ANALYTICS CAN HELP

Try it on your own data, with a free proof of concept

Business questions first, AI as a tool and not a hype machine, and results you can act on straight away.

1

Validate

Check your WMS, TMS or ERP extracts against schema and cross-field rules, so the KPIs start from data you can defend.

2

Score and rank

Compute OTIF by site, carrier and product against your targets, and rank the losses by value at risk.

3

Act and track

Assign owners by root cause, take the scorecard to your 3PL review, and watch the monthly trend.

Free PoC: tailored to your requirements and your company's analytics maturity.
