Kedros Analytics

VALUE PROPOSITION

Big-Company Analytics, Small-Company Budgets

Advanced analytics is no longer reserved for companies with big budgets.
AI has changed the game — and it can totally worth it.

Matt Protopapas, PhD

WELCOME

Every organization has data. Very few turn it into clarity.

My work rests on one simple promise: helping you understand what truly drives your operations, using AI and actual data as reference, so you can make faster, smarter and better-informed decisions.

With over 20 years of experience empowering people derive insights through data and analytical tools across 30+ European organizations, I've learned that transformation doesn't start with technology. It starts with people who want to see their business differently.

This deck shows how I approach analytics, the value it unlocks and the impact you can expect from our collaboration.

Matt Protopapas, PhD
Founder, Kedros Analytics

Some of the organizations I've worked with – either as an employee, a consultant /contractor, an employee of a consultancy firm, or a sub-contractor of another service provider.

HOW CAN ANALYTICS HELP?

Example use cases & AI generated demos. Everything designed to facilitate tangible business decisions.

Operations

Inventory optimization
How much of each product to order, and when — freeing cash without risking stockouts.

OTIF and logistics visibility
Which carrier lane to renegotiate, which SKU needs safety stock, and which dock to check.

Quality control
Lean Six Sigma: when to redesign the process, and whether rework costs justify investment.

Staffing with queueing theory
How many people to roster in each hour of each day, balancing wages against lost sales.

Depot location and routing
Where to put the depot and which routes the vans should drive, judged on total annual cost.

Finance

Capital budgeting
Which capital projects to fund, and which to reject, based on value created rather than IRR alone.

Working capital in inventory
Where to release cash tied up in excess stock, and where to invest more to stop stock-outs.

Portfolio optimization
Whether your portfolio is truly diversified or carries risk that isn't being paid for.

Demand forecasting
Which products can be ordered straight from the forecast, and which need a buffer.

Pricing and margins
Which products can take a price rise, and which discounts give margin away.

Marketing

Customer segmentation
Which segments deserve retention or win-back campaigns, and which to leave alone.

Market basket analysis
Which products to bundle, promote together or place near each other.

Lead scoring and valuation
Which channels to fund, and which are quietly wasting marketing spend.

A/B testing promotions
Whether a promotion really caused the sales lift, or the sales would have come anyway.

Pricing and promotions
Which discounts earn their keep, and which products should stay off the promo list.

Want more detail?

Every example on this slide has a full write-up on my blog: worked numbers, how to apply it to your own data, and downloadable demos.

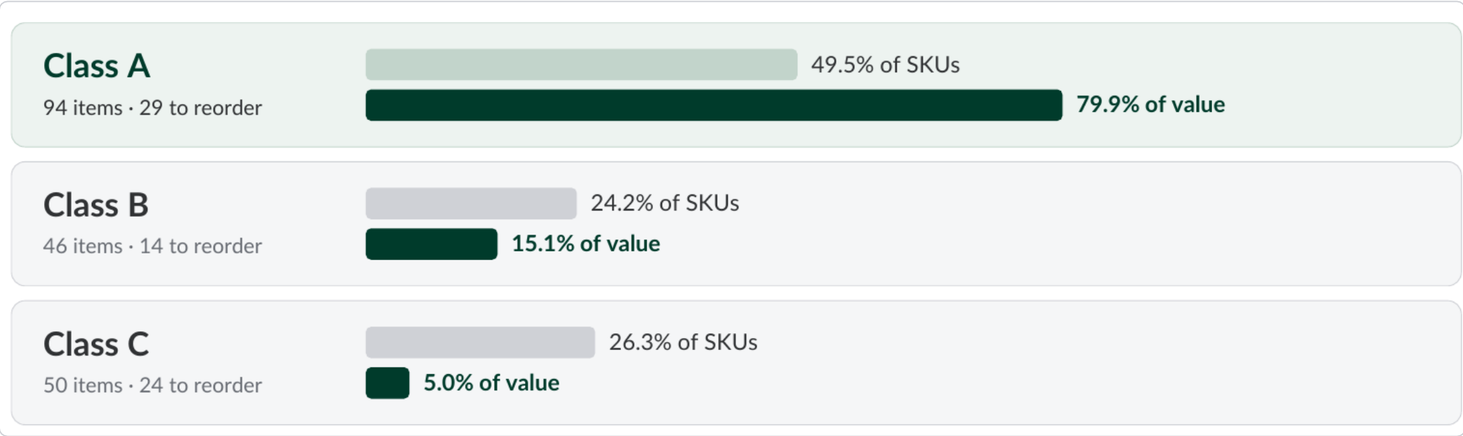

I recommend a visit for more details.

OPERATIONS · INVENTORY OPTIMIZATION

Free up cash without cutting a single product

Half your items hold nearly 80% of your inventory value. Know which ones deserve your attention, and exactly what to order and when.

100,000 €

back on the balance sheet from a 10% cut in excess stock on 1M € of inventory.

67 of 190

items flagged for reorder today, Class A first: a prioritized buying list instead of checking every SKU by hand.

THE DECISION IT ENABLES

How much of each product to order, and when: releasing cash tied up in excess stock without risking stockouts on the products that drive your revenue.

Illustrative figures from synthetic demo data.

MARKETING · LEAD SCORING AND VALUATION

Know which marketing channels deserve your budget

Referrals convert six times better than paid ads. No extra spend needed, just better allocation of the spend already happening.

+20%

monthly revenue from one extra point of conversion (5% to 6%) on the same 500 leads.

735 €

average value per lead in the demo: the number to hold against your cost per lead.

THE DECISION IT ENABLES

Which channels to fund, and which are quietly wasting marketing spend, by holding the value of a lead against what it costs you to get it.

OPERATIONS · OTIF AND 3PL TRACKING

Put a price on every missed delivery promise

Four root causes explain 80% of the money at risk: a short list a small company can actually work through.

56% sits in two causes
Stockouts and carrier delays are different problems with different owners.

Six causes share the last 20%
Supplier inbound delays, dock capacity, pick errors, weather, order entry and customer refusals.

2.78M €

of orders did not arrive as promised in the demo year: roughly one euro in eleven of shipped value.

494k €

late-delivered orders traced to one carrier at 77.6% on time against a 91.4% target: hard evidence for your 3PL review.

THE DECISION IT ENABLES

Which carrier lane to renegotiate, which SKU needs safety stock, and which warehouse dock to look at, backed by a scorecard built from your own data.

FINANCE · CAPITAL BUDGETING

The highest IRR is not the biggest value

Rank every capital request on one number, NPV: a larger project with a strong return beats a small one with a spectacular one.

$3.6M

swing between funding only projects with NPV above zero and funding everything proposed.

11 of 20

valid proposals clear NPV above zero. Funding the other nine would destroy $2.31M of value.

THE DECISION IT ENABLES

Which capital projects to fund, and which to reject, based on value created rather than IRR alone or who tells the best story.

OPERATIONS · STAFFING WITH QUEUEING THEORY

Put the right number of people on the right hours

In the demo café, Saturday needs 36 staff-hours and has 36, just in the wrong places. Moving hours fixes idle wages and queues together.

36 hours needed, 36 rostered

Same wage bill. Hiring or cutting would not fix it, only moving hours does.

4 idle hours, 4 queue hours

One too many at 8–10 and 18–20, one too few from 11 to 15.

95,000 €

a year saved versus today's roster in the demo café, for 19 more staff-hours a week.

361

walk-outs a week today: invisible on the payroll, because nobody logs the customer who didn't buy.

THE DECISION IT ENABLES

How many people to roster in each hour of each day, and which service promise (for example 80% served within 5 minutes) balances wage cost against lost sales.

SMALL & MID-SIZED COMPANIES CAN ACHIEVE SIGNIFICANT RETURN ON INVESTMENT…

Think advanced analytics is only for big companies? Think again

Modern AI tools have collapsed the cost and time of building serious analytics. What used to take an enterprise team and an enterprise budget is now within reach of every SME.

More than 10×

faster delivery than traditional analytics projects

A fraction

of the traditional cost — without cutting corners on quality

AI-powered insights

Chatbots can deliver insights seamlessly
Agents can leverage them autonomously

WHAT I DO

I help build analytical engines that drive action…

Analytical processes, reporting apps and AI-ready data platforms that improve performance, reduce operational friction and let your teams act with confidence.

- → **Reveal what truly drives performance** — the levers behind your numbers, not just the numbers
- → **Deliver insights automatically** — to the right people, across teams, without manual work
- → **Empower decision-makers** — with clarity and confidence at the moment of choice
- → **Lay AI-ready foundations** — so chatbots and agents can speak your business language

…EVEN AFTER A SINGLE ANALYTICS PROJECT

1 Decide Business Goal

This will define the analytics you need.

Which in turn determines which data are required.

As a starting point for your analytics journey, consider one of the example use cases or a report that tracks some KPIs (Key Performance Indicators).

Do we have data of good quality?

YES

NO

2a Good Data

Perform the analysis.

Generate insight.

Decide what to do next.

2b Bad Data

Data quality issues uncover underlying process issues.

Improvements can help the company, not only the data.

3 Improve Processes

Specify improvements.

Potentially employ advanced prescriptive analytics to do so.

Implement changes.

4 Confirm Gains

Analyze results to confirm gains.

Potentially use automated BI monitoring tools to ensure gains remain valid in the long run.

Optionally

5 Achieve Economies of Scale

Data repositories, refreshed automatically. They can be used to:

1. Repeat some analyses without extra effort
2. Monitor and improve data quality
3. Consolidate data for advanced analytics
4. Build AI agents that make simple decisions

After the first iteration, more advanced analytics can be supported:

- Analytical exercises your team does every day or for important strategic decisions
- Analytics recommended by consultants specializing in specific business functions
- Automated BI reports to monitor important metrics day-to-day, immediately

Next Iteration

…AND HELP COMPANIES CONTINUOUSLY IMPROVE PERFORMANCE

AI can help create code, but only after we understand the business specs, the data landscape and the goals.

- Determine goals & analytics to perform
- Identify data sources
- Design tools that help
- Export data & perform the analysis

Perform Analytics

Improve Processes

- Use generated insights to improve processes
- Even data quality issues indicate process gaps
- Determine & action points for improvement

Improvement points for the underlying business processes will always occur, regardless of the outcome of the analysis.

…building a platform of analytical assets that can also be reused in future exercises.

Decrease Costs

- Automate data retrieval & consolidation
- Automate data quality monitoring
- Automate analytics and report generation

Confirm Gains

- Confirm improvements by recalculating KPIs, perform analyses, or reviewing BI reports

WHY KEDROS ANALYTICS

Immediate benefits, not theory

- ✓ Over 20 years in Data and Analytics
- ✓ Proven track record with major organizations
- ✓ Broad cross-sector experience spanning diverse industries and business lines
- ✓ Full-stack delivery: from pipelines to analytics, to boardroom-ready dashboards
- ✓ AI as a tool – not as a hype machine

HOW WE CAN WORK TOGETHER

Contract Roles

Flexible contracting options to suit your specific needs.

End-to-end projects

Data pipelines, reporting apps and AI-powered analytics, delivered together with my collaborators.

Consulting

Consulting sessions tailored to what your company want to achieve next in their Data & Analytics journey.

WHAT YOU GAIN

Lasting capability, not a one-off report

Guidance in your journey to data-driven decisions

Continuously enhance analytical capabilities, solidify processes, while making sure company value is increased immediately.

Automated intelligence at scale

Automated KPI monitoring, advanced insights and reusable data assets to further increase productivity.

Context-aware AI capabilities

An AI-ready infrastructure where chatbots and agents understand your business language and support daily decisions.

A culture of a data-driven way of working

Teams learn to ask better questions, leverage AI tools, interpret insights and turn analytics into real actions.

A platform for long-term growth

Every analysis, report, and AI agent becomes part of a platform built for expansion and continuous improvement.
We can also discuss about a potentially free PoC (Proof of Concept), tailored to the requirements & the maturity level of your company.

TRACK RECORD

Selected projects

Fortune Global 500 company

Supply chain control tower

A balanced scorecard and OTIF dashboards with a Loss Tree and key drivers, a 3PL performance reporting pack, and a refactor of the Power BI and Snowflake models around dimensional modelling principles

Reports more than twice as fast, at roughly half the capacity cost

Fortune Europe 500 company

Data lakehouse and e-mobility BI

Led the migration to a Microsoft Fabric Medallion lakehouse, built the semantic model and DAX measures, and delivered Power BI reports on charging station utilization, availability and revenue — with automated data quality controls

One consolidated view of e-mobility performance, with governed self-service for analysts

Global manufacturing company

Analytical products for an AI-powered app

Designed a Microsoft Fabric data architecture and an AI-ready semantic layer so chatbots answer real business questions accurately, and introduced an AI-assisted engineering workflow for the team

Order-of-magnitude team productivity gains and markedly faster queries

TESTIMONIALS

What clients say about working with me

"

I hired Matt to develop advanced custom Power BI solutions. He successfully managed complex data requirements and delivered BI reports that met our technical specifications

Javier Fernandez Linares

Global Supply Chain Analytics Manager, Fortune Global 500 pharma

"

We had the privilege to co-operate with Matt, an excellent professional with out of the box thinking and always willing to assist. I do recommend Matt for complex projects

Ioannis Fousteris

Group ICT Director, leading Greek manufacturer

"

I worked with Matt for over a year to create advanced BI reports. I like his ability to connect with people, his professionalism and team skills and I recommend him for any such role

Angelos Paidas

Head of e-Mobility Products and Services, Fortune Europe 500 energy

Kedros Analytics

Want to make better decisions, faster?

Let's spend thirty minutes on your issues — no commitment, no jargon. You'll leave with at least one idea you can use, and we might even go on and plan a completely free PoC.
